DRAG DROP

You have an Exchange Server 2013 organization that contains several custom RBAC management roles.

You need to identify which RBAC scopes must be used to meet the following requirements:  
Manage only the mailboxes of the users in the sales department.

Manage the properties of all the mailbox databases.

Which RBAC scopes should you identify? (To answer, drag the appropriate RBAC scopes to the correct requirements. Each RBAC scope may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.)

Understanding Management Role Scopes: Exchange 2013 Help

Management role scopes enable you to define the specific scope of impact or influence of a management role when a management role assignment is created.

When you apply a scope, the role assignee assigned to the role can only modify the objects contained within that scope.

A role assignee can be a management role group, management role, management role assignment policy, user, or universal security group (USG)

Every management role, whether it's a built-in role or a custom role, has management scopes.

Management scopes can be either of the following:

Regular

A regular scope isn't exclusive. It determines where, in Active Directory, objects can be viewed or modified by users assigned the management role. In general, a management role indicates what you can create or modify, and a management role scope indicates where you can create or modify. Regular scopes can be either implicit or explicit scopes, both of which are discussed later in this topic.

Exclusive

An exclusive scope behaves almost the same as a regular scope. The key difference is that it enables you to deny users access to objects contained within the exclusive scope if those users aren't assigned a role associated with the exclusive scope. All exclusive scopes are explicit scopes, which are discussed later in this topic.

Scopes can be inherited from the management role, specified as a predefined relative scope on a management role assignment, or created using custom filters and added to a management role assignment.

Scopes inherited from management roles are called implicit scopes while predefined and custom scopes are called explicit scopes.

Implicit scopes are the default scopes that apply to a management role type. Because implicit scopes are associated with a management role type, all of the parent and child management roles with the same role type also have the same implicit scopes.

Implicit scopes apply to both built-in management roles and also to custom management roles.

Implicit scopes defined on management roles

Implicit scopes Description

**Organization** If Organization is present in the role's recipient write scope, the role can create or modify recipient objects across the Exchange organization.

If Organization is present in the role's recipient read scope, roles can view any recipient object across the Exchange organization.

This scope is used only with recipient read and write scopes.

**MyGAL** If MyGAL is present in the role's recipient write scope, the role can view the properties of any recipient within the current user's global address list (GAL).

If MyGAL is present in the role's recipient read scope, the role can view the properties of any recipient within the current GAL.

This scope is used only with recipient read scopes.

**Self** If Self is present in the role's recipient write scope, the role can modify only the properties of the current user's mailbox.

If Self is present in the role's recipient read scope, the role can view only the properties of the current user's mailbox.

This scope is used only with recipient read and write scopes.

**MyDistributionGroups** If MyDistributionGroups is present in the role's recipient write scope, the role can create or modify distribution list objects owned by the current user.

If MyDistributionGroups is present in the role's recipient read scope, the role can view distribution list objects owned by the current user.

This scope is used only with recipient read and write scopes.

**OrganizationConfig** If OrganizationConfig is present in the role's configuration write scope, the role can create or modify any server or database configuration object across the Exchange organization.

If OrganizationConfig is present in the role's configuration read scope, the role can view any server or database configuration object across the Exchange organization.

This scope is used only with configuration read and write scopes.

**None** If None is in a scope, that scope isn't available to the role. For example, a role that has None in the recipient write scope can't modify recipient objects in the Exchange organization.

Explicit scopes are scopes that you set yourself to control which objects a management role can modify.

Although implicit scopes are defined on a management role, explicit scopes are defined on a management role assignment.

This enables the implicit scopes to be applied consistently across all management roles unless you choose to use an overriding explicit scope. For more information about management role assignments, see [Understanding Management Role Assignments](#).

Explicit scopes override the implicit write and configuration scopes of a management role. They don't override the implicit read scope of a management role. The implicit read scope

continues to define what objects the management role can read.

Explicit scopes are useful when the implicit write scope of a management role doesn't meet the needs of your business. You can add an explicit scope to include nearly anything you want as long as the new scope doesn't exceed the bounds of the implicit read scope. The cmdlets that are part of a management role must be able to read information about the objects or containers that contain objects for the cmdlets to create or modify objects. For example, if the implicit read scope on a management role is set to Self, you can't add an explicit write scope of Organization because the explicit write scope exceeds the bounds of the implicit read scope.

**The OrganizationConfig implicit scope**

If OrganizationConfig is present in the role's configuration write scope, the role can create or modify any server or database configuration object across the Exchange organization.

If OrganizationConfig is present in the role's configuration read scope, the role can view any server or database configuration object across the Exchange organization.

**CAN MANAGE THE PROPERTIES OF ALL OF THE MAILBOX DATABASES.**

**The Self Implicit Scope** If Self is present in the role's recipient write scope, the role can modify only the properties of the current user's mailbox.

If Self is present in the role's recipient read scope, the role can view only the properties of the current user's mailbox.

**CANNOT BE SELF AS IT PERTAINS TO ONLY THE PARTICULAR USER'S MAILBOX**

**The Organization relative scope**

If Organization is present in the role's recipient write scope, the role can create or modify recipient objects across the Exchange organization.

If Organization is present in the role's recipient read scope, roles can view any recipient object across the Exchange organization.

This scope is used only with recipient read and write scopes.

**NOT MEANT FOR MANAGING MAILBOX DATABASES**

A recipient is any mail-enabled object in the Active Directory directory service to which Exchange can deliver or route messages.

In Microsoft Exchange recipients are comprised of mailbox users, mail-enabled users, mail contacts, distribution groups, security groups, dynamic distribution groups, and mail-enabled public folders.

**The Recipient filter explicit scope**

Recipient filter scopes use filters to target specific recipients based on recipient type or other recipient properties such as department, manager, location, and more.
