NEW QUESTION: 1

A. Option D
B. Option C
C. Option B
D. Option A
Answer: A
Explanation:
Explanation
By putting the system in the DMZ (demilitarized zone) we increasethe security, as the system should be opened for remote access.
A DMZ is a computer host or small network inserted as a "neutral zone" between a company's private network and the outside public network. It prevents outside users from getting direct accessto a server that has company data. A DMZ often contains servers that should be accessible from the public Internet.

NEW QUESTION: 2
Which of the following statements pertaining to protection rings is false?
A. Programs operating in inner rings are usually referred to as existing in a privileged mode.
B. They support the CIA triad requirements of multitasking operating systems.
C. They provide users with a direct access to peripherals
D. They provide strict boundaries and definitions on what the processes that work within each ring can access.
Answer: C
Explanation:
In computer science, hierarchical protection domains, often called protection rings, are

mechanisms to protect data and functionality from faults (fault tolerance) and malicious behaviour (computer security). This approach is diametrically opposite to that of capability-based security.

Computer operating systems provide different levels of access to resources. A protection ring is one of two or more hierarchical levels or layers of privilege within the architecture of a computer system. This is generally hardware-enforced by some CPU architectures that provide different CPU modes at the hardware or microcode level.

Rings are arranged in a hierarchy from most privileged (most trusted, usually numbered zero) to least privileged (least trusted, usually with the highest ring number). On most operating systems, Ring 0 is the level with the most privileges and interacts most directly with the physical hardware such as the CPU and memory.

Special gates between rings are provided to allow an outer ring to access an inner ring's resources in a predefined manner, as opposed to allowing arbitrary usage. Correctly gating access between rings can improve security by preventing programs from one ring or privilege level from misusing resources intended for programs in another. For example, spyware running as a user program in Ring 3 should be prevented from turning on a web camera without informing the user, since hardware access should be a Ring 1 function reserved for device drivers. Programs such as web browsers running in higher numbered rings must request access to the network, a resource restricted to a lower numbered ring.

"They provide strict boundaries and definitions on what the processes that work within each ring can access" is incorrect. This is in fact one of the characteristics of a ring protection system.

"Programs operating in inner rings are usually referred to as existing in a privileged mode" is incorrect. This is in fact one of the characteristics of a ring protection system.

"They support the CIA triad requirements of multitasking operating systems" is incorrect. This is in fact one of the characteristics of a ring protection system.

NEW QUESTION: 3
展示を参照してください。 ip route 0.0.0.0 0.0.0.0 10.13.0.1
120コマンドでルーターに静的なデフォルトルートを設定する場合、ルーターはどのように応答しますか？

A. 既存のOSPFデフォルトルートが削除されるまで、新しい静的ルートを無視します
B. ルーティングテーブル内の特定の一致エントリなしで、Gigabit Ethernet0 / 1へのトラフィックの送信を開始します
C. 2つのデフォルトルート間でトラフィックのロードバランシングを開始します
D. ルーティングテーブル内の既存のOSPFルートを、新しく構成された静的ルートで即座に置き換えます

Answer: A
Explanation:
Our new static default route has the Administrative Distance (AD) of 120, which is bigger than the AD of OSPF External route (O*E2) so it will not be pushed into the routing table until the current OSPF External route is removed.
For your information, if you don't type the AD of 120 (using the command "ip route 0.0.0.0 0.0.0.0
10.13.0.1") then the new static default route would replace the OSPF default route as the

default AD of static route is 1. You will see such line in the routing table:
S* 0.0.0.0/0 [1/0] via 10.13.0.1

NEW QUESTION: 4
Which operation runs as part of the PROTECT STGPOOLprocess?
A. repair of extents marked as damaged
B. cleanup of the storage pool
C. identification of damaged extents
D. audit of the storage pool
Answer: A
Explanation:
Explanation/Reference:
As part of the PROTECT STGPOOL operation, processes might run to repair damaged extents in the target server's storage pool. The repair operation occurs under the following conditions:
Both the source server and the target server must be at V7.1.5 or later.

Extents that are already marked as damaged on the target server are repaired.

The repair process does not run an audit process to identify damage.
-Only target extents that match source extents are repaired. Target extents that are damaged but have

no match on the source server are not repaired.
Note: PROTECT STGPOOL protects a directory-container storage pool.
Use this command to protect data in a directory-container storage pool by storing a copy of the data in another storage pool on a replication target server or on the same server by protecting the data to tape.
When you protect the directory-container storage pool, you can later try to repair damage in the storage pool by using the REPAIR STGPOOL command.
